

AUTONOMOUS ROBOT PLATFORM

Paul Rayes

ECE 298

The Project

*To create a low-cost autonomous platform,
to be used as the basis for other projects*

Why?

- Autonomous navigation and wireless communication are difficult
- Building the basic structure is not what many people want to do
- Hobbyists and students who want to build a robot may not have the knowledge, experience, or time to build it from scratch

Existing Solutions

- 3pi, Ardubot, and other small hobby robots
 - Not fully autonomous
- Roomba
 - Not designed for this use
- Commercial autonomous robots
 - Cost thousands of dollars
- The ideal solution does not exist

Shortened Constraints & Criteria

- Inexpensive (ideally under \$400)
- Autonomous
- Easy to use
- Communicates wirelessly
 - With other robots and control computer
- Can be used as a foundation for other projects

Work done this semester

- Started with chassis & motor kit
- Controlled by two Arduinos
- Added ultrasonic sensor
- Wrote code for obstacle avoidance
- Started designing rack system

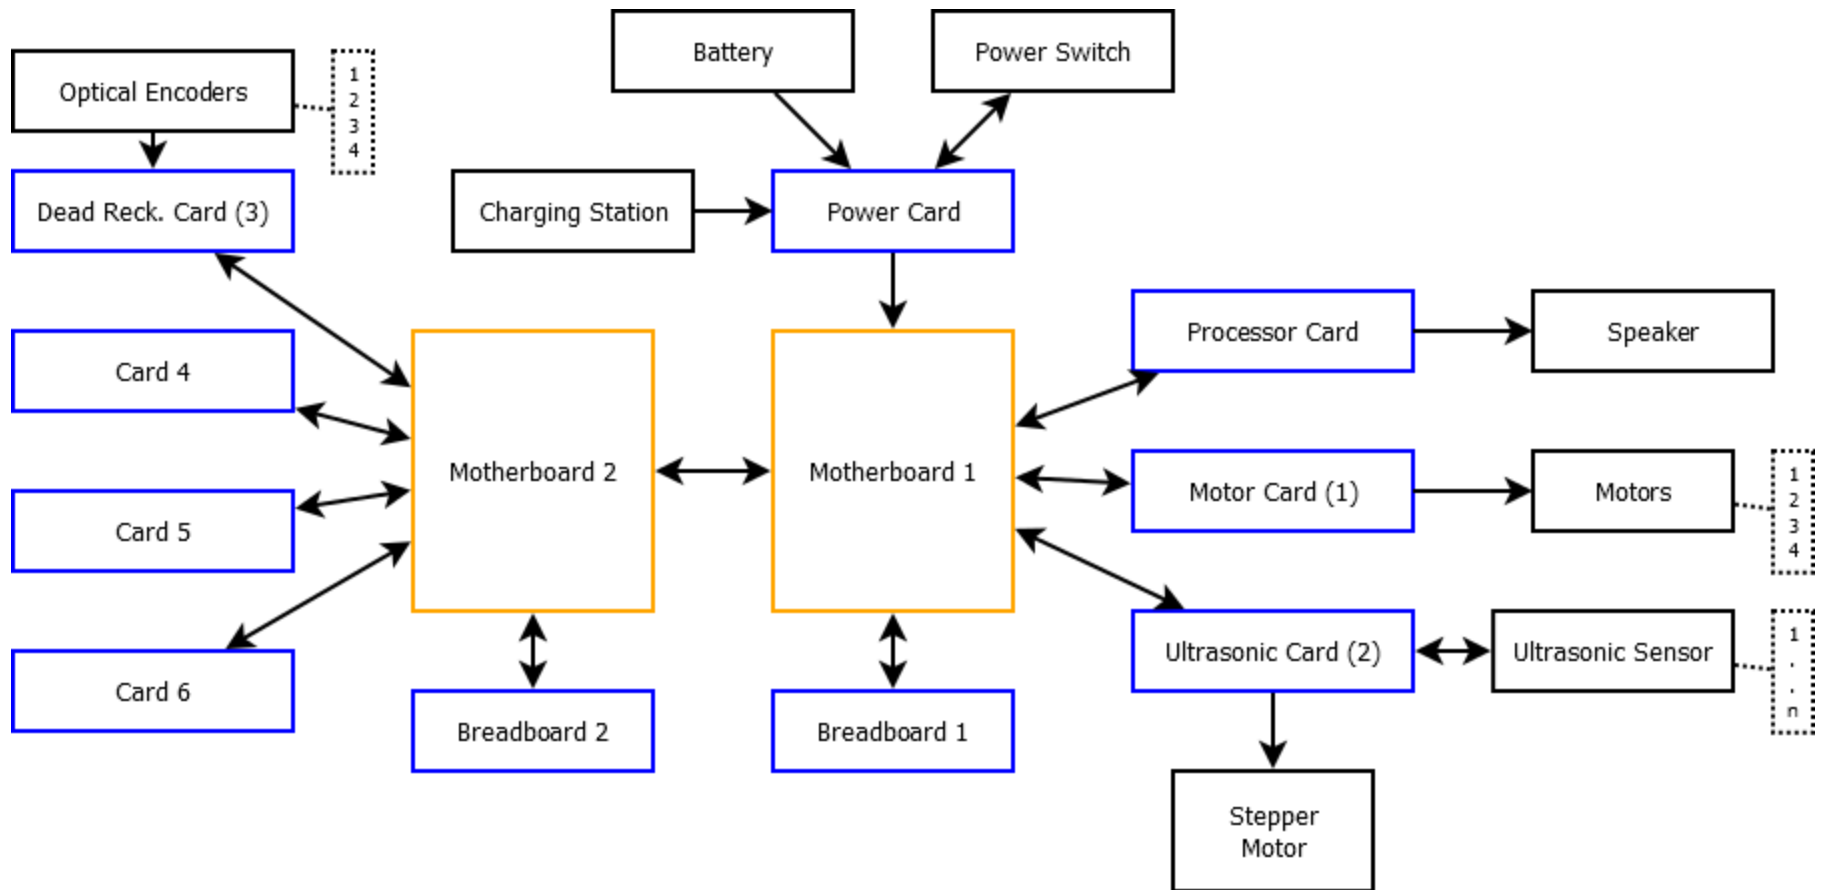

The Present

- Robot does not see all obstacles
- Circuit boards for rack system need designed

The Near Future

- Larger team – 2 or 3 people
- Next level of navigation: maze navigation
- Map creation
- Basic control system
- Implement rack system
- Wireless communication

Q & A
